

Management Reporting: Saving Accountants time.

Modern business requires accurate, timely information at a click of a button. Whilst accounting systems are great at processing vast quantities of data, they can often not produce the exact reports you require without a little add-in.

Background

This article was written by Barry Snashall of Trax UK back in September 2010, and posted onto **Accounting Web**, one of the World's largest accounting websites; it has proved very useful with Accountants when trying to find that perfect piece of software that will **speed up their management accounts** and is as relevant today as it was six years ago.

This genuinely transforms the way management reports are created.

HW Fisher

Barry has over **twenty years' experience** working within the Accounting systems industry, an Accountant himself who always wanted a simple solution which achieves the **maximum results in the shortest time** and this couldn't be achieved through any other software.

How can The Analyser help you?

At the **click of a button**, "The Analyser" extracts actual current and budget/forecast data from any combination of nominal codes, departments and funds for any date range. Additional benefits include the option to **add prior year's data alongside the current year for comparative purposes** and to report on single or multiple Sage companies, all in one workbook

The Analyser was born out of the constraints other report writers place upon the user. It is an impressive yet simple, timesaving reporting Tool that extracts the figures directly from the Sage data into Excel.

Also the drill down feature allows the user, from the face of their management information, to drill down to the nominal activity not just for one code but any combination of codes all from Excel **without having to open Sage**.

The added benefit is that the numbers are returned to Excel so the user is able to **use Excel reporting and graphing and dashboard capabilities to further enhance their reports**. It's as good as you are in Excel and Barry offers advance Excel training too.

If you need to produce management accounts and business analysis then you should have copy of The Analyser.
